                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is the nucleotide sequence of the 5'-end of a cDNA provided in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence was used as the representative sequence from a human clone which was used in homology searches to identify the clone.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  972 ac-agttggcttactggtttcatagtttcccggagctctacttccagaaagtcaggaaac 1030

The invention relates to isolated breast tumour proteins and nucleic acids that encode them, including immunogenic fragments of the proteins. Also included are expression vectors expressing the proteins, transformed cells and antibodies raised against the proteins or an antigen presenting cell expression the protein. The proteins and antigen presenting cell expression the protein. The proteins and nucleic acids may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate breast tumour protein expression, i.e. breast tumours and breast cancer e.g by gene therapy. The nucleic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The proteins, nucleic acids and antibodies may be used in assays to identify modulactors (e.g. antagonists) of breast tumour protein expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of the proteins in samples (e.g. by enzyme linked immunosorbant assay (ELISA)) and in other immuno purification diagnostic techniques. The present sequence is a constant tumour coval library, isolated by subtractive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           641 cagoggaagggotacoctoggggtocaggacoctttacoattatggggtoaaagatotgg 700

These sequences can be used in the diagnosis and treatment of cancers, particularly breast tumours.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                     Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the CDNA between the Noti site and the oligo-dT track served to verify it as a clone from the normalized embryo at 13 dpc library cDNA Library Preparation: M.B. Soares Lab Clone distribution: clones will be available through
Norway rat.

                                                                                      //duclinost=E. Coll Strain Allo Coold, Ti-Tessizatt, F-Testivations C57BL/6J (female) was obtained from the Jackson Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was prepared from a 6-5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (qi|4732114|qbj|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the listert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                               This sequence represents an endoplasmic reticulum protein (WAR-1) amino acid sequence. The invention includes rat and human WAR-1 sequences, expression vectors containing the DNA, cells transformed with the hybridise to the DNA encoding WAR-1, and probes and primers which proliferation of cancer cells, and is used in the treatment and diagnosis of cancers including highly malignant sarcomas.

The present invention describes a screening method for secretory and membrane proteins consisting of transformation of a cell with separate expression vectors for the sense and antisense RNA of DNA encoding an endoplasmic reticulum membrane protein participating in endoplasmic reticulum transport of proteins. Also described are: (1) secretory and cell membrane proteins identified by the screening method; (2) drug compositions containing these proteins; (3) host cells transformed by the separate expression vectors of the method; and (4) the preparation of secretory and cell membrane proteins by culture of the transformants. The method can be used for the identification and preparation of proteins for use in the treatment and prevention of diseases such as cancer, disorders of the nervous system, immune disorders (including represents a specifically claimed rat WAR-1 protein from the present
                                                                                                            Transformation of a cell with separate vectors expressing the sense and antisense strands of WAR-1 DNA for screening secretory and membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AEGLPSGSRTLYHYGVKDLATVFFYMLVAIIIHATIQEYVLDKLSRRLQLTKGKQNKLNE 120

                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents an endoplasmic reticulum protein (WAR-1) amino acid sequence. The invention includes rat and human WAR-1 sequences, expression vectors containing the DNB, cells transformed with the expression vector, antibodies against WAR-1, and probes and primers which hybridise to the DNA encoding WAR-1. The WAR-1 protein inhibits the proliferation of cancer cells, and is used in the treatment and diagnosis of cancers including highly malignant sarcomas.

NAME OF THE PROPERTY OF THE PR

Tang YT;

Liu C,

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences of the invention.

Second and polymer data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -AEGLPSGSRTLYHYGVKDLATVFFYMLVAIIIHATIQEYVLDKLSRRLQLTKGKQNKLN 119

Also described are: (1) secretory and cell membrane proteins identified by the screening method; (2) drug compositions containing these proteins; (3) host cells transformed by the separate expression vectors of the method; and (4) the preparation of secretory and cell membrane proteins by culture of the transformants. The method can be used for the identification and preparation of proteins for use in the treatment and prevention of diseases such as

                                                                                                                                              molecules have been determined. Primers for synthesising the full length the CDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched CDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         dermatological; neuroprotective; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic; antiangiogenic; gene therapy; inflammation; immune disorder; haematopoietic cell disorder; autoimmune disorder; allergic reaction; graft versus host disease; organ rejection; haemostatic; thrombolytic; cardiovascular disorder; infection;

AAC77607 to AAC78448 encode the human cancer associated proteins given tissues and cells the genes are expressed in. Example of activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirhyroid; antialreary; immunomodulator; antidiabetic; antiasthmatic; antithyroid; antialreary; antiarthritic; antibacterial; neuroprotective; cardiant; thrombolytic; coagulant; cootropic; vasotropic; antipsoriatic and antiangiogenic. The nootropic; vasotropic; antipsoriatic and antiangiogenic. The nootropic; vasotropic; antipsoriatic and antiangiogenic. The colyncleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Colyncleotides, polypeptides, aponics and antiagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The pettoders, neurological disease and apparation or viral infections. The pettoders, neurological disease, agonists and antagonists may be also be used in drug screens. AAC78457 and AAC78457 and AAC78450 represent sequences used in the exemplification of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel nucleic acid sequences (A) that are expressed at high level in normal prostatic tissue. Polypeptides (I) encoded by (A) are used: (a) for identifying agents for treatment of prostatic cancer and (b) for therapy of prostate cancer, optionally where expressed by gene therapy methods. (A) is also used to isolate (II)-length genes (for gene therapy) and for recombinant production of (I), which can be used to raise specific antibodies. (A) are identified by assembly of ESTS (expressed sequence tags) before these are analyzed for expression pattern (tissue specificity). This approach eliminates many of the false results, as regards tissue specificity, associated with known methods that use single (usually short) ESTS. AAV48304 *Y48456 represent peptides encoded by the expressed sequence tags described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid expressed at high level in normal prostatic tissue and encoded polypeptides, used to treat cancer and screen for therapeutic

The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention.
 Isolated nucleic acid molecule encoding a reproductive system antigen

 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell interactions in higher eukaryotes for the development of insecticides, therapeutics and harmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA
 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

 The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic BNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
 61 A-EGLPSGSRTLYHYGVKDLATVFFYMLVAIIIHATIQEYVLDKLSRRLQLTKGKQNKLN 119
 New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures

 The Saccharomyces cerevisiae LAG1 gene product is composed of a life-span limiting domain (see AAR86812) and a life-span extending domain (see AAR86812) and a life-span extending domain (see AAR86811). Overexpression of the LAG1 gene in older cells has a rejuvenating effect, which not only increases cellular life span, but also reproductive capacity and cellular tolerance to stress factors such as starvation and low pH. These cells may be used for the production of recombinant proteins. By increasing the life span of recombinant cells, the need for overexpression of recombinant gene products is avoided, and therefore any subsequent adverse effects on the host cell.

This sequence is the human longevity-assurance protein homologue of
the invention, designated LAPH-1. LAPH-1 and LAPH-2 are involved in
signal transduction and cell cycle regulation, and may play a role in
requlating the balance between cell proliferation and apoptosis.
Increased expression of LAPH-1 or LAPH-2 may increase susceptibility to
disregulation of cellular homeostatic pathways. Antagonists of LAPH-1 or
LAPH-2 can be used to treat a disorder associated with disregulation of
cellular homeostasis or with aging, cancers, disorders associated
with inflammation or autoimmune disease including ALDS, Addison's
disease, adult respiratory distress syndrome, allergies, anaemia, asthma,
atherosclerosis, bronchitis, cholecystitis, Crohn's disease, ulcerative
colitis, atopic dermatitis, dermatomyositis, diabetes mellitus,

 Nature 357:47-52(1992).
-!- FUNCTION: STIMULATORY OR REQUIRED FOR THE TRANSLOCATION SECRETORY PROTEINS ACROSS THE ER MEMBRANE.
-!- SUBCELLULAR LOCATION: Endoplasmic reticulum membrane.
-!- SIMILARITY: BELONGS TO THE LASSI FAMILY.

 NATURE 396.133-140(1998).

-! FUNCTION: CYTOCHROME C OXIDASE IS THE COMPONENT OF THE RESPIRATORY CHAIN THAT CATALYZES THE REDUCTION OF OXYGEN TO WATER. SUBUNITS 1-3 FORM THE FUNCTIONAL CORE OF THE ENZYME COMPLEX. CO I IS THE CATALYZES CATALYZES CATE ENZYME. ELECTRONS ORIGINATING IN CYTOCHROME C ARE TRANSFERRED VIA THE COPPER A CENTER OF SUBUNIT 2 AND COPPER A OF SUBUNIT 1 TO THE BIMETALLIC CENTER FORMED BY HEME A3 AND COPPER B (BY SIMILARITY).

-I- CATALYZIC ACTIVITY: 4 ferrocytochrome c + 0(2) = 4 ferricytochrome
 -i- PATHWAY: TERMINAL STEP IN THE RESPIRATORY CHAIN.
-i- SUBCELLULAR LOCATION: Integral membrane protein.
-i- SIMILARITY: BELONGS TO THE HEME-COPPER RESPIRATORY OXIDASE FAMILY.

 9
 "A second terminal oxidase in Sulfolobus acidocaldarius.";
Eur. J. Blochem. 224.151-159(1994).
-!- FUNCTION: TERMINAL OXIDASE IS THE COMPONENT OF THE RESPIRATORY
CHAIN THAT CATALYZES THE REDUCTION OF OXYGEN TO WATER. SOXM
FORMS THE FUNCTIONAL CORE OF THE ENZYME COMPLEX.
-!- FUNCTION: CATALYTIC SUBUNIT OF THE BINETALLIC CENTER OF SOXM
IN A QUINOL ARE TRANSFERRED TO THE BIMETALLIC CENTER OF SOXM
FORMED BY A HEME AND COPPER B.
-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
 -!- SIMILARITY: IN THE C-TERMINAL SECTION; BELONGS TO THE CYTOCHROME C OXIDASE SUBUNIT 3 FAMILY.
 -!- COFACTOR: TWO HEME GROUPS AND COPPER B.
-!- PATHWAY: TERLINLE STEP IN THE RESPIRATORY CHAIN.
-!- FATHWAY: TERLINLE STEP IN THE RESPIRATORY CHAIN.
-!- SUBUNIT: FORMS A COMPLEX WITH AT LEAST SOXC AND A 30 KDB RIESKE
FE-S PROTEIN, BUT NEITHER WITH SOXA NOR SOXB.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- FUR. SOXM IS PROBABLY A PRECURSOR FORM OF SUBUNITS I AND III.
-!- SIMILARITY: IN THE N-TERLINAL SECTION; BELONGS TO THE HEME-COPPER RESPIRATORY OXIDASE FAMILY.

 MAPPING INFORMATION:
Mapping information for this clone was provided by Dr. John D.
McPherson, Department of Genetics, Washington University, St. Louis
MO. For additional information about the map position of this
 Submitted (08-FEB-2002) Department of Genetics, Washington University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA On Feb 5, 2002 this sequence version replaced g1:16077043.
טעבייורנים (נוס-SEP-2001) Genome Sequencing Center, Washington
University School of Medicine, 4444 Forest Park Parkway, St. Louis,
MO 63108, USA
 Submitted (05-FEB-2002) Genome Sequencing Center, Washington University School of Medicine, 4444 Forest Park Parkway, St. Louis,
 The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E., Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at the Roswell Park Cancer Institute
 NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
 all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats, all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
 Data from AC013556 was used to finish the clone, AC093805.
Polymorphisms have been identified between AC013556 and AC093805.
 NEIGHBORING SEQUENCE INFORMATION:
Actual start of this clone is at base position 1 of RP11-32609;
actual end is at base position 165538 of RP11-32609.
 This sequence was finished as follows unless otherwise noted:
 The sequence of AC012532 has been incorporated into AC093805.
 Center: Washington University Genome Sequencing Center

 NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 70 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the flinished sequence as soon as it is available and the accession number will be preserved.
 Worley,K.C.
Direct Submission
Submitted (12-JAN-2002) Human Genome Sequencing Center, Department
Submitted (12-JAN-2002) Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
Center: Baylor College of Medicine
 Consensus quality: 127470 bases at least Q40 Consensus quality: 134419 bases at least Q30 Consensus quality: 139475 bases at least Q20 Estimated insert size: 122947; sum-of-contigs estimation Quality coverage: Ox in Q20 bases; agarose-fp estimation Quality coverage: 2.3x in Q20 bases; sum-of-contigs estimation

Homo sapiens chromosome 4 clone RP11-724E21 map 4, LOW-PASS SEQUENCE SAMPLING.
 sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

~

including cancer of diagnosis and treatment proliferation for use in trasarcomas of high malignancy

οχ g δ g Qγ qq Db δ ò Db Ω q δ protein (WAR-1). The invention includes rat and human WAR-1 sequences, expression vectors containing the DNA, cells transformed with the expression vector, antibodies against WAR-1, and probes and primers which hybridise to the DNA encoding WAR-1. The WAR-1 protein inhibits the proliferation of cancer cells, and is used in the treatment and diagnosis of cancers including highly malignant sarcomas. ö 120 180 180 240 Gaps 240 300 9 9 300 360 360 420 420 540 600 099 099 720 780 tatagggcacgcgtggtcgacggcccgggctggtactgggattttgctgttattatg ctattgttgttgttataattaatgatctgaagaataaccagagctctataggtttatcatgat tactaatgaagatgccactaaaaaaaagaattcaggagcatcttggcggtggcagcgagt tagggggggggggttgatttccttcctgcctccgccgtccccctggtgcgcatgctca ctgacttcggggatgggaagtggagccccgggagctgctaccgtggcggcggctgtgag ggetecgtaagaagagcaccaagaaccccccgtteteagccaggaatteatectgcaga gaacagcagaagcatccatcgtgtttctcactcttcagcacagtgttgctgtccctgcag tggataaaattaacaagagaatgcagttcaccaaagcgaaacaaaacaagtttaacgagt Length 2288; ó Indels Sequence 2288 BP; 612 A; 467 C; 503 G; 706 T; 0 other; 21; ; 0 DB DNA encoding an Score 2288; Pred. conjuncteotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (1) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disorders. Grensiscs, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human caid sequences data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO

 The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been stolated and nuclocities sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length enriched.
 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.

cc and the recombination process used to produce the polypeptide. The recombination process used to produce the polypeptide. The present invention also discloses the method of applying the polypeptide. The polypertide and polynucleotides in treating immunological disorder, malignant tumour. CC cancer and other diseases. The antagonist resisting the polypeptide and its treatment effect is also disclosed. Diagnosis and determination concerned based on the disorimination of the mutation in the nucleic acid sequence and the change in the polypeptide expression level, and the application of the polymelectides encoding the BioTRAM. The present sequence represents the coding sequence of the novel human BioTRAM and process protein as described in the invention.

The present invention describes a screening method for secretory and membrane proteins consisting of transformation of a cell with separate expression vectors for the sense and antisense RNA of DNA encoding an endoplasmic reticulum membrane protein participating in endoplasmic celiculum transport of proteins. Also described are: (1) secretory and compositions containing these proteins; (3) host cells transformed by the separate expression vectors of the method; and (4) the preparation of secretory and cell membrane proteins by culture of the transformants. The method can be used for the identification and preparation of proteins for use in the treatment and prevention of diseases such as cancer, disorders of the nervous system, immune disorders (including allergies and rheumatism) and skeletal disorders. The present sequence
 Transformation of a cell with separate vectors expressing the sense antisense strands of WAR-1 DNA for screening secretory and membrane

The present invention describes a screening method for secretory and membrane proteins consisting of transformation of a cell with separate expression vectors for the sense and antisense RNA of DNA encoding an endoplasmic reticulum membrane protein participating in endoplasmic reticulum ransport of proteins. Also described are: (1) secretory and cell membrane proteins identified by the screening method; (2) drug compositions containing these proteins; (3) host cells transformed by the separate expression vectors of the method; and (4) the preparation of secretory and cell membrane proteins by culture of the transformants. The method can be used for the identification and preparation of proteins for use in the treatment and prevention of diseases such as cancer, disorders of the mervous system, immune disorders (including allergies and rheumatism) and skeletal disorders. The present sequence

AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB4398 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnecary; immunomodulator; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiantity immunomodulator; continchyroid; antidiametic; antidiate; thrombolytic; coagulant; concreptic; vasotropic; antipsoriatic and antiangiogenic. The reactions of polymeticletides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Complyincleotides, polypeptides and number disorders and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoletic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate caption, and antagonists may be also be used in drug screens. AAC78449 to the present sequences used in the exemplification of the present invention or the present sequences used in the exemplification of
 isolated nucleic acids comprising sequences encoding for treating or diagnosing e.g. cancer -

Human secreted protein; hyperproliferative disorder; autoimmune disorder; immune deficiency disorder; blood disorder; inflammatory disorder; infectious disorder; gene therapy; antimicrobial; hepatotropic; immunosuppressive; antirheumatic; ss.
 The present invention relates to the isolation of novel cDNA sequences which encode human secreted proteins. The cDNA sequences have been derived from a variety of human tissues. The invention also provides a method for producing proteins from these polynucleotide sequences. The proteins are useful for identifying compounds that modulate their activity and production, and the cell is also useful for identifying compounds that modulate expression of the polynucleotide sequences encoding the secreted proteins. The sequences of the invention are useful for treating diseases such as hyperproliferative disorders (e.g. cancer), immune deficiency disorders (e.g. severe combined immunodeficiency (SCID)), autoimmune disorders (e.g. multiple

This sequence represents the DNA encoding an endoplasmic reticulum protein (WAR-1). The invention includes rat and human WAR-1 sequences, expression vectors containing the DNA, cells transformed with the expression vector, antibodies against WAR-1, and probes and primers which hybridise to the DNA encoding WAR-1. The WAR-1 protein inhibits the proliferation of cancer cells, and is used in the treatment and diagnosis of cancers including highly malignant sarcomas.

 The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the CDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the CDNA are useful for clarifying the function of the protein encoded by the CDNA are useful for clarifying the function of the protein encoded by the CDNA in libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA assity without any special methods. The present sequence is the nucleotide sequence of the 5'-end of a cDNA provided in the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence was used as the representative sequence from a human clone which was used in
 homology searches to identify the clone.
Note: The sequence data for this patent did not form part of the printed
specification, but was obtained in CD-ROM format directly from EPO.

This invention describes novel nucleic acid sequences (A) that are expressed at high level in normal prostatic tissue. Polypeptides (I) proceed by (A) are used: (a) for identifying agents for treatment of prostatic cancer and (b) for therapy of prostate cancer, optionally where expressed by gene therapy methods. (A) is also used to isolate full-length genes (for gene therapy) and for recombinant production of (I), which can be used to raise specific antibodies. (A) are identified by assembly of ESTS (expressed sequence tags) before these are analyzed for expression pattern (tissue specificity). This approach eliminates many of the false results, as regards tissue specificity, associated with known methods that use single (usually short) ESTS. AAZ33477-Z33540 processed sequence tags described in the method of the
 at high level in normal prostatic tissue and

The present invention describes a screening method for secretory and membrane proteins consisting of transformation of a cell with separate expression vectors for the sense and antisense RNA of DNA encoding an endoplasmic reticulum membrane protein participating in endoplasmic reticulum transport of proteins. Also described are: (1) secretory and cell membrane proteins identified by the screening method; (2) drug compositions containing these proteins; (3) host cells transformed by the separate expression vectors of the method; and (4) the preparation of secretory and cell membrane proteins by culture of the transformants. The method can be used for the identification and preparation of proteins for use in the treatment and prevention of diseases such as cancer, disorders of the nervous system, immune disorders (including allergies and rheumatism) and skeletal disorders. The present sequence

cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA asily without any special methods. The present sequence is the nucleotide asily without any second of a cDNA provided in the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.

nucleic acids that encode them, including immunogenic fragments of the proteins. Also included are expression vectors expressing the proteins. The included are expression vectors expressing the proteins and antigen presenting cell expression the protein. The proteins and antigen presenting cell expression the protein. The proteins and cliebases associated with inappropriate breast tumour protein expression, i.e. breast tumours and breast cancer e.g by gene therapy. The nucleic acids and their complements may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The proteins, nucleic acids and antibodies may be used in assays to identify modulators (e.g. antagonists) of breast tumour protein expression and activity. The antibodies and antagonists may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate agents for detecting the presence of the proteins in samples (e.g. by enzyme linked immunosorbant assay (ELISA)) and in other immuno-purification diagnostic techniques. The present sequence is a cDNA from a breast tumour cDNA library isolated by subtractive

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 This sequence represents an endoplasmic reticulum protein (WAR-1) amino acid sequence. The invention includes rat and human WAR-1 sequences, expression vectors containing the DNA, cells transformed with the expression vector, antibodies against WAR-1, and probes and primers which hybridise to the DNA encoding WAR-1. The WAR-1 protein inhibits the proliferation of cancer cells, and is used in the treatment and diagnosis of cancers including highly malignant sarcomas.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, collypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical clisorders involving partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating the polypeptide and polynucleotide sequences have applications in cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences of the invention.

Company of the produce data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO very

 The present invention describes a screening method for secretory and membrane proteins consisting of transformation of a cell with separate expression vectors for the sense and antisense RNA of DNA encoding an endoplasmic reticulum membrane protein participating in endoplasmic reticulum transport of proteins. Also described are: (1) secretory and cell membrane proteins identified by the screening method; (2) drug compositions containing these proteins; (3) host cells transformed by the separate expression vectors of the method; and (4) the preparation of secretory and cell membrane proteins by culture of the transformants. The method can be used for the identification and preparation of proteins for use in the treatment and prevention of diseases such as cancer, disorders of the nervous system, immune disorders (including allergies and rheumatism) and skeletal disorders. The present sequence the identificating protein from the present incometion.

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nuclectide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by length enriched cDNA libraries that were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA assily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.

 This sequence represents an endoplasmic reticulum protein (WAR-1) amino acid sequence. The invention includes rat and human WAR-1 sequences, expression vectors containing the DNA, cells transformed with the expression vector, antibodies against WAR-1, and probes and primers which pybridise to the DNA encoding WAR-1. The WAR-1 protein inhibits the proliferation of cancer cells, and is used in the treatment and diagnosis of cancers including highly mailignant sarcomas.

 expressed at high level in normal prostatic tissue. Polypeptides (1) encoded by (A) are used: (a) for identifying agents for treatment of prostatic cancer and (b) for therapy of prostatic cancer and (b) for therapy of prostate cancer, optionally where expressed by gene therapy methods. (A) is also used to isolate full-length genes (for gene therapy) and for recombinant production of (1), which can be used to raise specific antibodies. (A) are identified by assembly of ESTs (expressed sequence tags) before these are analyzed for expression pattern (tissue specificity). This approach eliminates many of the false results, as regards tissue specificity, associated with known methods that use single (usually short) ESTs. AAV48304-Y48456 represent peptides encoded by the expressed sequence tags described in the method of the invention.
 New nucleic acid expressed at high level in normal prostatic tissue and encoded polypeptides, used to treat cancer and screen for therapeutic

 The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.

 life-span limiting domain (see AAR86812) and a life-span extending domain (see AAR86812) and a life-span extending domain (see AAR86811). Overexpression of the LAG1 gene in older cells has a rejuvenating effect, which not only increases cellular life span, but also reproductive capacity and cellular tolerance to stress factors such as starvation and low pH. These cells may be used for the production of recombinant proteins. By increasing the life span of recombinant cells, the need for overexpression of recombinant gene products is avoided, and therefore any subsequent adverse effects on the host cell.

This sequence is the human longevity-assurance protein homologue of
the invention, designated LAPH-1. LAPH-1 and LAPH-2 are involved in
signal transduction and cell cycle regulation, and may play a role in
regulating the balance between cell proliferation and apoptosis.

Increased expression of LAPH-1 or LAPH-2 may increase susceptibility to
disregulation of cellular homeostatic pathways. Antagonists of LAPH-1 or
LAPH-2 can be used to treat a disorder associated with disregulation of
cellular homeostasis or with aging, cancers, disorders associated
with inflammation or autoimmune disease including AIDS, Addison's
disease, adult respiratory distress syndrome, allergies, anaemia, asthma,

 Sodium- and chloride-dependent glycine transporter 1 (GlyT1) (GlyT-1).
 :| : | | : | | | : | | : : : : : | | | ---QEVIDGCGFSIGHQQQFASWI-AYKVAPFLGKKRESVEDLKLPGWLNIFHDNIVSTA 256
 271
 -:- SUBCELLULAR LOCATION: Integral membrane protein.
-:- ALTERNATURE PRODUCTS: 3 ISORORAR'S GLYTT-1A, GLYT-1B AND GLYT-
1C (SHOWN HERE); ARE PRODUCED BY ALTERNATIVE SPLICING.
-:- TISSUE SPECIFICITY: ALL GLYT-1 SUBTYPES CAN BE FOUND IN BRAIN,
KIDNEY, PANOREAS, LUNG, PLACENTA, LIVER. BUT GLYT-1C SUBTYPE IS
ONLY FOUND IN THE BRAIN.
-:- SIMILARITY: BELONGS TO THE SODIUM:NEUROTRANSMITTER SYMPORTER

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Minimum DB seq length: 0 Maximum DB seq length: 2000000000 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
